

Abstract geometric lines in the top left corner, consisting of several overlapping, irregular polygons and lines in a light brown color.

myFlixList

- a CareerFoundry case study -

WHAT:

A single-page, responsive app with routing, interactions, and different interface views.

OVERVIEW:

myFlixList is a movie app built using the MERN (MongoDB, Express, React, Node) stack, as part of a project I completed with CareerFoundry.

PROCESS:

The approach to building the app was two-fold. For the business-side logic, I built an API using REST architecture. The client-side logic was built using React.

BUSINESS-SIDE LOGIC

Building the API

This step was important, as it built the structure of what was eventually the data for the app.

I routed HTTP requests using Express and defined the endpoints for my REST API. I then used MongoDB to create a database.

Authentication and authorization

For this, I used basic HTTP and JWT (token-based) authentication for user authorization and incorporated data validation logic, security, and storage controls.

Postman

The endpoints were all tested using Postman.

```
... JS index.js M X {} package.json M <> documentation.html

JS index.js > ...
1 const express = require("express");
2 const bodyParser = require("body-parser");
3 const uuid = require("uuid");
4 const app = express();
5
6 app.use(bodyParser.json());
7
8 > let users = [
19 ];
20
21 > let movies = [
209 ];
210
211 // HTTP requests
212
213 // CREATE
214 app.post("/users", (req, res) => {
215   const newUser = req.body;
216
217   if (newUser && newUser.name) {
218     newUser.id = uuid.v4();
219     users.push(newUser);
220     res.status(201).json(newUser);
221   } else {
222     res.status(400).send("users need names");
223   }
224 });
225
226 // UPDATE
227 app.put("/users/:id", (req, res) => {
228   const { id } = req.params;
229   const updatedUser = req.body;
230
231   let user = users.find((user) => user.id == id);
232
233   if (user) {
234     user.name = updatedUser.name;
235     res.status(200).json(user);
236   } else {
237     res.status(400).send("no such user");
238   }
239 });
```

CLIENT-SIDE LOGIC

Building the front-end of the app

This was done using React and was my first time using the JavaScript library. The app used Bootstrap for UI styling and responsiveness.

Required views

For this project, it was required to have different views within the app. These included a main view, single movie view, login view, signup view, and a profile view.

Hosting

The project was deployed to GitHub and hosted on Heroku.

IN CONCLUSION

The most challenging part...(besides learning React)

Time itself was definitely the biggest challenge for me with this project. I was in the midst of a job and completing a house remodel in order to move across the country. When I finally got settled and things in order, I was able to finish the project, but it took much longer to complete than I initially planned.

If I were to change anything or do different...

If I were to do the project over, I would probably select a certain genre or collection of films to build the project around (i.e. Harry Potter, Star Wars, sci-fi films). I would also perhaps design the layout of the app slightly different.

Overall...

I am proud of the end result, knowing I learned a lot and can pick specific areas I can improve on with a project like this. React was enjoyable to work with but also difficult at first to learn.

A series of thin, light-brown lines forming an abstract geometric pattern in the top-left corner of the slide. The lines intersect to create various triangular and polygonal shapes.
